

## Essay by Artiom

We have lots of global problems on our planet. And if we try to solve all the problems one by one we'll run out of time. Humanity needs to solve several of them at the same time. So my take at this contest of saving humanity is bicycles. How the world could be saved by bicycles?

Air pollution and noise are destroying our planet slowly. But the traffic is making those problems harder to solve. For example, truck is transporting garbage to recycle it. But because of the traffic it arrives later than it should have been. We could make people use bicycles instead of cars. It will solve traffic because less people will use cars, cars will make less air pollution and noise. We could make more people use bicycles if they were easier to use. Just making more roads for bicycles is going to make difference. Bicycles are better in every aspect except for speed. They are healthier, they make less pollution, they are just easier to use than transport. If you ask me, I think electric cars are not the solution. Because they will make a lot of traffic and they are expensive, so only rich people could buy them.

Electronic cars might be the solution in the future, but for now, I think bicycles are the best option.
